Networking notes:

- APIM will be internet facing component.
- The 3 app services will be accessible only within the VNet, and only APIM service who can access to it (rules/service tags to be address in the NSG)
- NSG of the subnets will be allowing only the APIM access (besides the other VNet resources).
- SQL DB, Storage account, app service and the Key vault will be VNET integrated with private link, so only accessible from the VNET,
- The SQL DB will be accessible by the developers, 2 options: they need a P2P VPN, other option is whitelist the corporate network IP ranges on the SQL server firewall.
- Traffic between app service and key vault/storage account will be via the private endpoint, Traffic between the app service and the SQL DB will be via the private link.
- WAF (Web application firewall) on top of the APIM to prevent from common exploits and vulnerabilities.
